FOMC Pauses in June Even as Labor Market Remains Strong

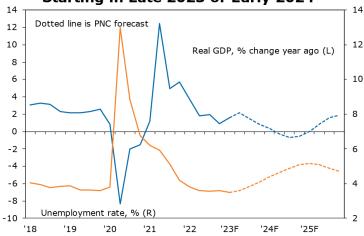

- Employment growth was far stronger than expected in May, according to a survey of employers from the Bureau of Labor Statistics, with the economy adding a net 339,000 jobs over the month. This is well above the consensus expectation of 180,000. In addition, there were large upward revisions to job growth in both March and April of a combined 91,000. Over the last three months the economy has added more than 280,000 jobs on average, well above the economy's long-run potential. This is unwelcome news for the Federal Reserve, which would like to see job growth slow to a more sustainable monthly pace of around 125,000. The unemployment rate jumped 0.3 percentage point to 3.7%, the highest the rate has been since October 2022. This was also the biggest one-month increase in the unemployment rate since it soared in April 2020 at the beginning of the pandemic. The 3.4% rate in April 2023 matched the lowest unemployment rate since 1969.
- The Federal Open Market Committee kept the federal funds rate unchanged in a range between 5.00% and 5.25% on June 14, as widely expected. This is the first FOMC meeting where the committee has not raised the fed funds rate since January 26, 2022, when the rate was in a range between 0.00% and 0.25% coming out of the pandemic. This tightening in monetary policy since the spring of 2022 has weighed on economic growth, although the economy continues to expand in mid-2023. While the FOMC kept the fed funds rate unchanged in June, it is likely to raise it again in the near term given the tight labor market and inflation that is running far too hot. FOMC participants' own projections, as well as speeches from Fed officials including Chair Powell, point to further increases in the fed funds rate this year.
- Inflation is slowing but remains elevated. The overall consumer price index was up 4.1% in May from one year earlier. This was down from 4.9% in April and a peak of almost 9% in mid-2022. The core CPI, which excludes volatile food and energy prices and is a better measure of underlying inflation trends, was up 5.3% year-over-year in May. This was down from 5.5% in May and 6.6% in September 2022. Core inflation is easing only gradually. The central bank's preferred inflation gauge is a different measure, the personal consumption expenditures price index, which tends to run a bit below the CPI, but it is also well above the FOMC's 2% objective. Core services, including housing services, is the primary driver of high inflation in 2023; this is different from last year, when goods inflation was the dominant factor.

Forecast Calls for a Mild Recession Starting in Late 2023 or Early 2024

Economy Continues to Expand in the First Half of 2023

Recession Looms Despite Current Labor Market, Consumer Strength

The U.S. economy remains in good shape heading into the second half of 2023. In particular, the labor market is exceptionally strong, with job growth well above its pre-pandemic pace and the unemployment rate historically low. With the strong job market consumers continue to increase their spending, supporting overall economic growth. But inflation is much too high for the Federal Reserve, and the rapid tightening in monetary policy since early 2022 is likely to result in a recession later this year or early next. But there is still the possibility that the U.S. economy can avoid a recession, and even if a downturn does come, it is likely to be short and mild.

The biggest reason for optimism about the U.S. economy is the labor market. Although job growth has slowed from the initial recovery from the pandemic, it is still very strong. The U.S. economy has added an average of more than 300,000 jobs per month through the first five months of 2023; this compares to average gains of 400,000 per month in 2022, and 600,000 per month in 2021. But given that underlying growth in the labor force is only around 100,000 or 150,000 per month, the current pace of job gains is unsustainable over the longer run. The unemployment rate, which soared to almost 15% in April 2020 at the worst of the pandemic, was down to 3.4% in April of this year, matching the lowest rate since 1969. The unemployment rate rose slightly to 3.7% in May, but this is still below the approximately 4% rate that the Federal Open Market Committee views as consistent with its mandate of "maximum employment."

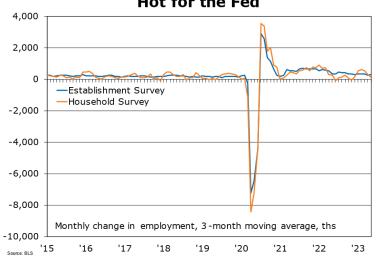

This very tight labor market is driving gains in consumer spending. Demand for labor remains strong, and businesses continue to increase pay to attract new workers. Average hourly earnings are up around 4.5% in the first half of 2023 relative to last year. While this is below the almost 6% pace in early 2022, it is well above pre-pandemic wage growth of around 3.5%. Wage and job gains are allowing households to increase their purchases, even after accounting for higher prices; inflation-adjusted consumer spending was up more than 2% in the first quarter of 2023 compared to a year earlier. With these purchases making up about two-thirds of the U.S. economy, this is supporting overall economic growth.

But the current situation is unsustainable. While the tight labor market and strong income gains are supporting consumer spending, they are also contributing to high U.S. inflation. The Fed wants to create a bit more slack in the job market and push wage growth down to around 3.5%, consistent with its inflation target of 2%. To do this job growth will need to slow substantially, to below 100,000 per month. And so the central bank has raised interest rates aggressively over the past couple of years in an attempt to cool off the economy, the labor market in particular.

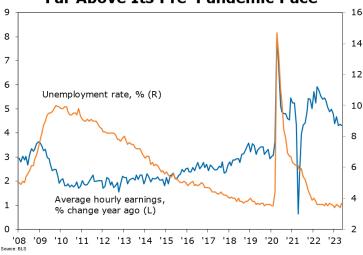

The FOMC has a delicate task. It wants to slow economic growth by raising interest rates, but not raise them by so much that the economy falls into a recession, when broad economic activity actually contracts, including declines in consumer spending, household incomes (excluding government aid), and employment. It is going to be very difficult for the Fed to achieve this balance, and the most likely outcome is a U.S. recession starting later this year or in early 2024. But recession is not imminent given the current strength of the job market. Nor is it inevitable. If the Fed gets a few lucky breaks on inflation it is possible that the economy could experience weak growth over the next year or two, a slight increase in the unemployment rate, and a gradual return to 2% inflation. It would not be a "soft landing," more like a "bumpy landing," but given the current strong situation for consumers the likelihood the economy avoids a near-term downturn is about one-in-three.

But given aggressive Fed tightening the more likely outcome is recession. However, it should be mild and short, with consumers a big reason why. Layoffs should be small because firms, having suffered through severe worker shortages, will want to avoid being caught flat-footed once the economy starts to pick up again; this will limit the hit to consumer incomes and consumer spending. In addition, households have generally been responsible, with low debt burdens and consumer delinquency rates, limiting the need for belt tightening during a downturn. PNC's forecast is for a small contraction in real GDP of less than 1% starting in about six months and lasting into mid-2024. The unemployment rate will increase in the second half of this year, ending 2023 at above 4%, and then peak at slightly above 5% in early 2025. Core inflation will slow with weaker demand, moving back to the Federal Reserve's 2% objective by this time next year. Slowing inflation and a deteriorating labor market will lead to Federal Reserve rate cuts starting in early 2024, allowing for an economic recovery beginning in mid-2024.

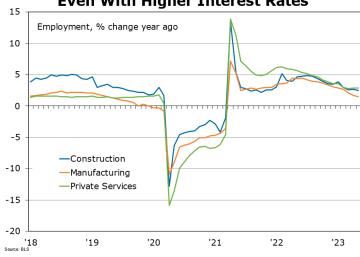

Job Growth Remains Too Hot for the Fed

Wage Growth Is Slowing, But Is Far Above Its Pre-Pandemic Pace

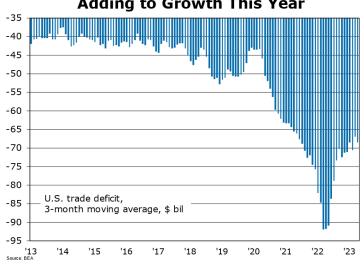

Construction Job Growth Continues Even With Higher Interest Rates

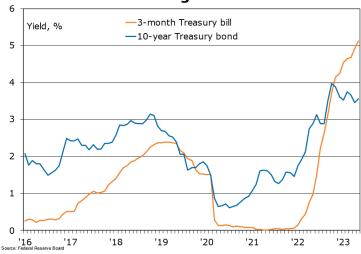

Real Incomes Are Growing Thanks to Strong Labor Market, Slower Inflation
